FAQ: keeping track of info at breaks

For qstn 1,-- While debugging xv6, if I keep breakpoints at 7c00 and 10000c, and when gdb hits the first breakpoint(7c00) it never reaches 10000c, I would have to hit continue to reach the second breakpoint and in that process, I lose track of what goes to stack and registers. How do we tackle this?

I can suggest you store (take note of) the values after hitting each breakpoint, by viewing the stack and registers using the relevant gdb commands.
